

# eCommerce and AI

A guide by **Data Drillers**

# Introduction

1. Pfizer's go-to-market motions for their vaccines business revolve around two major customer bases: healthcare providers (HCP) and their patients (D2C)
2. The executive leadership team ("ELT") recently discovered that healthcare providers are routinely under-stocking their vaccine fridges
3. Pfizer has a direct sales channel that allows for the distribution of vaccines to healthcare providers through next-day mail
4. Our responsibility as data analysts is to develop an application to help solve this problem

# Goals of Our Study

1. Develop an application to help solve the problem of health care providers routinely under-stocking their vaccine fridges.
2. Conduct an analysis that helps Pfizer understand which health care providers are under-stocking their fridges.
3. Make recommendations based on our analysis to solve this problem
4. (If possible) make predictions on the expected increase in revenue

# Business Question & Hypothesis

# Business Questions

1. What is the difference between the purchasing pattern between PHYSICIANS and LARGE GROUPS?
2. How do we predict the demand based on the data we have?
3. How can we tell which customers are understocking?
4. What is the expected increase in revenue after we design the app?

# Hypotheses

- We predict that demands will be higher for LARGE groups (pharmacies: CVS, Walgreen, etc.) than for PHYSICIANS.
  - LARGE groups sees more patients on a regular basis, PHYSICIANS purchase vaccines more on specific needs of their patients
- We expect that vitamins and meds for common diseases such as flu, heart, allergy are the best-seller of Pfizer.
- We expect an increase in revenue of over 100 million (~2%) after our app
- We predict the demands to be higher during the fall and winter seasons and more customers will understock when it's out-of-season
  - Flu season and flu vaccine

# Data & Methods

# Data and Methods

- Data - customer\_id, date, large group/physician, state, brand, doses, price
- Linear regression to predict doses based on time
  - On each individual customer and brand of vaccine
  - On Large Groups vs Physicians
  - On all customers based on state
- Split time into time periods and predict doses for future 5 periods
- Difference between the mean doses of future and past is understocking
- Assumptions:
  - Our data satisfies the conditions of linear regression
  - Mean doses in each period reflects demands

# Findings

# Single Customer Prediction

# Predicted Values For Each Customer

# Predicting Demand

- Using regression, we can predict the demand for each customer based off of existing data
- Problem: Inefficient
- Solution: Segment data by a combination of order type (physician/ large group) and product → Eliminate understocking

# Managing the Supply Chain

- Segmenting data → Focus on understocking problem
- By state: Focus both on product type as well as states with larger understocking problem

# Each State's Largest Difference

# Recommendations

# Recommendations

- Focus on selling to physicians
  - More number of vaccines understocking
  - Less brands that are understocked
- Sell smaller quantities more frequently to manage supply chain

# Recommendations: Working with Physicians

- Encourage HCP to create an appointment-based system
  - Reduce the amount of walk in patients
  - Especially helpful for rare meds that we don't produce a lot of
- Send notification to HCP (through texts or emails) based on past purchasing behavior
  - When they should expect a shortage of certain meds
  - Useful for erratic or cyclical order histories

# Recommendation: Working with Large Groups

- Focus on “ARILATAPIDE” brand
  - Over 50% of understocking doses for large groups
- Try to sell larger bundles

The background is a solid pink color. In the top right corner, there is a geometric pattern consisting of several squares and triangles in different shades of pink, creating a stepped or architectural effect.

# Impact

# Impact

- Fasten the process of delivering meds from Pfizer to patients
- Reduce delivery costs
- Maximize resources efficiency at pharmacies
- **Expected increase in revenues of ~ 2%**

E(revenue increased) = estimated understocking rate (25 doses)

\* estimated successful of the program (70%)

\* average price for doses (\$307)

\* customers (28,625)

**= \$153,787,812.5**
